
The Brand

[SK 537 121]

The Brand exposes part of the Brand Hills Formation and part of the overlying mud-rich turbidites of the Swithland Formation. The latter formation elsewhere contains the trace fossil *Teichichnus* (Bland and Goldring, 1995), which is considered indicative of a Cambrian rather than Precambrian age. McIlroy *et al.* (1998, fig. 6) indicate a correlation of the Swithland formation with the higher parts of the Hartshill Formation and the lower part of the overlying Purley Shale Formation (see site report for Woodlands Quarry, above).
