## Site no.: B5

**Site name:** Burn of Gowal

**Grid reference:** [NO 23841 80481]

**Locality:** Upper reaches of Glen Clova, south of Broad Cairn

**GCR Status:** N/A

**GCR No.:** N/A

**Type:** Natural landform and natural exposures

**Description:** A glen on the flanks of which gently dipping sheet joints formed parallel to the land surface of a pre-glacial shallow river valley are truncated by the classically U-shaped form of a glacially incised valley. The area also contains good exposures of the contact between the Lochnagar Granite Pluton and its country rocks (Dalradian Supergroup).

**Justification:** A good example of glacial modification of a pre-glacial landscape (perhaps one of the best in the CNP outwith the Cairngorm Mountains). Also one of the best examples in the CNP of the contact between a major intrusion and its host rocks.
