## Site no.: Q9

**Site name:** Beinn a' Ghlo landslides

**Grid reference:** [NN 95977 74565]

**Locality:** The northern and eastern flanks of Beinn a' Ghlo, especially within the steep sided valley of the Allt Fheannach

**GCR Status:** N/A

**GCR No.:** N/A

**Type:** Landform assemblage

**Description:** Several large rock slope failures, including creep, antiscarps and open tension cracks. A relatively recently formed tension crack [NN 9575 7450] was observed behind the main backscarp of one of these landslides.

**Justification:** An atypical cluster of landslide features that requires further research to fully explain. Landslides have influenced the long- term landscape evolution of the region and they tend to cluster within relatively recently formed glacial breaches
