Geoconservation in GeoMôn

Geoconservation is a hot topic – the UK has so much geological heritage in the form of geological exposures, historical locations in the development of geology and important mining/quarrying sites. Many of these are of vital scientific interest, others of important historical significance and many used by local communities, schools, amateur groups or university groups for field study. Geoconservation in GeoMôn takes many forms, we promote knowledge about important sites to increase interest in them. We report sites to the local planning authorities to ensure they are aware should any planned development affect access. We contribute to statutory authority (Natural Resources Wales) knowledge and the Geological Conservation Review (GCR) scheme. Our sites are mapped onto [DataMap Wales](#) the GIS portal for environmental data in Wales.
